A state-of-the-art review of research findings that contribute to an understanding of hypertension and the best measures for its prevention and control, whether in individual patients or entire populations. Noting that elevated blood pressure is a massive health problem in almost every country, the report argues that programs for hypertension control should be an integral part of all national health care systems. With this goal in mind, the report aims to help policy makers appreciate the significance and complexities of hypertension, understand the options available for control and then select the most appropriate mix of interventions. Details range from recommended procedures for obtaining an accurate assessment of blood pressure through advice on the best drugs for first-line treatment of hypertensive patients to a discussion of ways to educate populations about relevant lifestyle changes Throughout the report, population-based and individual approaches are presented as complementary, synergistic strategies for hypertension control. To assist physicians as well as policy makers, the report includes abundant recommendations based on the best scientific evidence for the management of different patient groups. A section on the clinical assessment of the hypertensive patient explains the components of a coherent step-wise diagnostic process involving history taking physical examination and laboratory investigation. Included are an assessment of the most suitable drugs for first-line treatment and guidelines for developing management plans for mild hypertension, moderate and severe hypertension, resistant hypertension and hypertensive emergencies. In view of the need to assure that scarce resources are invested wisely, the report also discusses and compares the cost-effectiveness of different management strategies.

Does your child speak a different language? Sometimes they waver for your attention, and other times they ignore you completely. Sometimes they are filled with gratitude and affection, and other times they seem totally indifferent. Attitude. Behavior. Development. Everything depends on the love relationship between you and your child. When children feel loved, they do their best. But how can you make sure your child feels loved? Since 1992, Dr. Gary Chapman's best-selling book *The 5Love Languages* has helped millions of couples develop stronger, more fulfilling relationships by teaching them to speak each others' love language. Each child, too, expresses and receives love through one of five different communication styles. And your love language may be totally different from that of your child. While you are doing all you can to show your child love, he may be hearing it as something completely opposite. Discover your child's primary language and learn what you can do to effectively convey unconditional feelings of respect, affection, and commitment that will resonate in your child's emotions and behavior.

The WHO Guidelines on Hand Hygiene in Health Care provide health-care workers (HCWs), hospital administrators and health authorities with a thorough review of evidence on hand hygiene in health care and specific recommendations to improve practices and reduce transmission of pathogenic microorganisms to patients and HCWs. The present Guidelines are intended to be implemented in any situation in which health care is delivered either to a patient or to a specific group in a population. Therefore, this concept applies to all settings where health care is permanently or occasionally performed, such as home care by birth attendants. Definitions of health-care settings are proposed in Appendix 1. These Guidelines and the associated WHO Multimodal Hand Hygiene Improvement Strategy and an Implementation Toolkit (<http://www.who.int/gpsc/en/>) are designed to offer health-care facilities in Member States a

conceptual framework and practical tools for the application of recommendations in practice at the bedside. While ensuring consistency with the Guidelines recommendations, individual adaptation according to local regulations, settings, needs, and resources is desirable. There is a limiting belief around in vitro fertilization (IVF) that must be reframed: the idea that it is only a technical, difficult, painful and artificial process. IVF is another one of those wonderful proofs of God's love towards us. Therefore, it is nothing but a christic alternative to enable men and women to achieve their paternity and maternity dreams. It was from this perspective that the author, Gabriela Lacerda, a former trying woman and mother of two children via assisted reproductions, shares with her readers a spiritual perspective about the most advanced treatment for couples who have difficulty to get pregnant. In this book, she talks about the metaphysical teachings that were essential to achieve her much-dreamed-of positive in her first in vitro fertilization attempt, giving life to her son Gael, and again, three years later, from the transfer of a single frozen embryo that enabled the arrival of her second son, Benício. What may be seen as good fortune from a distance, for her, who experienced it with a lot of energy, it was the certainty that there was a spirituality watching over every detail of her journey as a conscious trying woman. The one that goes beyond physical symptoms and scarcity thoughts. The one that acknowledges that life goes beyond the visible, the material world. Welcome to the wonderful world of assisted reproduction from a spiritual perspective. Read each page with an open heart. It is safe to get pregnant easily via in vitro fertilization.

Handbook of Human Factors and Ergonomics in Health Care and Patient Safety Mosby Incorporated

This open access book describes the results of natural language processing and machine learning methods applied to clinical text from electronic patient records. It is divided into twelve chapters. Chapters 1-4 discuss the history and background of the original paper-based patient records, their purpose, and how they are written and structured. These initial chapters do not require any technical or medical background knowledge. The remaining eight chapters are more technical in nature and describe various medical classifications and terminologies such as ICD diagnosis codes, SNOMED CT, MeSH, UMLS, and ATC. Chapters 5-10 cover basic tools for natural language processing and information retrieval, and how to apply them to clinical text. The difference between rule-based and machine learning-based methods, as well as between supervised and unsupervised machine learning methods, are also explained. Next, ethical concerns regarding the use of sensitive patient records for research purposes are discussed, including methods for de-identifying electronic patient records and safely storing patient records. The book's closing

chapters present a number of applications in clinical text mining and summarise the lessons learned from the previous chapters. The book provides a comprehensive overview of technical issues arising in clinical text mining, and offers a valuable guide for advanced students in health informatics, computational linguistics, and information retrieval, and for researchers entering these fields.

This book presents a simple and general method for conducting statistical power analysis based on the widely used F statistic. The book illustrates how these analyses work and how they can be applied to problems of studying design, to evaluate others' research, and to choose the appropriate criterion for defining "statistically significant" outcomes. *Statistical Power Analysis* examines the four major applications of power analysis, concentrating on how to determine: *the sample size needed to achieve desired levels of power; *the level of power that is needed in a study; *the size of effect that can be reliably detected by a study; and *sensible criteria for statistical significance. Highlights of the second edition include: a CD with an easy-to-use statistical power analysis program; a new chapter on power analysis in multi-factor ANOVA, including repeated-measures designs; and a new One-Stop PV Table to serve as a quick reference guide. The book discusses the application of power analysis to both traditional null hypothesis tests and to minimum-effect testing. It demonstrates how the same basic model applies to both types of testing and explains how some relatively simple procedures allow researchers to ask a series of important questions about their research. Drawing from the behavioral and social sciences, the authors present the material in a nontechnical way so that readers with little expertise in statistical analysis can quickly obtain the values needed to carry out the power analysis. Ideal for students

and researchers of statistical and research methodology in the social, behavioral, and health sciences who want to know how to apply methods of power analysis to their research.

Originally published in 1952 by a towering figure in nursing history, this book stresses the then novel theory of interpersonal relations as it was relevant to the work of nurses. Her framework suggested that interaction phenomena that occur during patient-nurse relationships have qualitative impact on patient outcomes. While the past four decades have seen a substantial expansion in the use and understanding of interpersonal theory, such as cognitive development and general systems theory, this classic book remains a useful foundation for all nurses as so much subsequent work used this work as its starting point. Springer Publishing Company is delighted to make this book available again.
