[Discovering Physical Anthropology by Larsen, Clark Spencer](#) National Academies Press

A New York Times-bestselling author explains how the physical world shaped the history of our species When we talk about human history, we often focus on great leaders, population forces, and decisive wars. But how has the earth itself determined our destiny? Our planet wobbles, driving changes in climate that forced the transition from nomadism to farming. Mountainous terrain led to the development of democracy in Greece. Atmospheric circulation patterns later on shaped the progression of global exploration, colonization, and trade. Even today, voting behavior in the south-east United States ultimately follows the underlying pattern of 75 million-year-old sediments from an ancient sea. Everywhere is the deep imprint of the planetary on the human.

From the cultivation of the first crops to the founding of modern states, *Origins* reveals the breathtaking impact of the earth beneath our feet on the shape of our human civilizations.

### **The Natural History of Humankind**

Cambridge University Press

How did life evolve on Earth? The answer to this question can help us understand our past and prepare for our future.

Although evolution provides credible and reliable answers, polls show that many people turn away from science, seeking other explanations with which they are more comfortable. In the book *Science, Evolution, and Creationism*, a group of experts assembled by the National Academy of Sciences and the Institute of Medicine explain the fundamental methods of science, document the overwhelming evidence in support of biological evolution, and evaluate the alternative perspectives offered by advocates of various kinds of creationism, including "intelligent design." The book explores the many fascinating inquiries being pursued that put the science of evolution to work in preventing and treating human disease, developing new agricultural products, and fostering industrial innovations. The book also presents the scientific and legal reasons for not teaching creationist ideas in public school science classes. Mindful of school board battles and recent court decisions, *Science, Evolution, and Creationism* shows that science and religion should be viewed as different ways of understanding the world rather than as frameworks that are in conflict with each other and that the evidence for evolution can be fully compatible with religious faith. For educators, students, teachers, community leaders, legislators, policy makers, and parents who seek to

understand the basis of evolutionary science, this publication will be an essential resource.

This book provides a novel focus on adaptive explanations for cranial and postcranial features and functional complexes, socioecological systems, life history patterns, etc. in early primates. It further offers a detailed rendering of the phylogenetic affinities of such basal taxa to later primate clades as well as to other early/recent mammalian orders. In addition to the strictly paleontological or systemic questions regarding *Primate Origins*, the editors concentrate on the adaptive significance of primate characteristics. Thus, the book provides

the broadest possible perspective on early primate phylogeny and the adaptive uniqueness of the Order Primates.

Today many school students are shielded from one of the most important concepts in modern science: evolution. In engaging and conversational style, *Teaching About Evolution and the Nature of Science* provides a well-structured framework for understanding and teaching evolution. Written for teachers, parents, and community officials as well as scientists and educators, this book describes how evolution reveals both the great diversity and similarity among the Earth's organisms; it explores how scientists approach the question of evolution; and it illustrates the nature of science as a way of knowing about the natural world. In addition, the book provides answers to frequently asked questions to help readers understand many of the issues and misconceptions about evolution. The book includes sample activities for teaching about evolution and the nature of science. For example, the book includes activities that investigate fossil footprints and population growth that teachers of science can use to introduce principles of evolution. Background information, materials, and step-by-step presentations are provided for each activity. In addition, this volume: Presents the evidence for evolution, including how evolution can be observed today. Explains the nature of science through a variety of examples. Describes how science differs from other human endeavors and why evolution is one of the best avenues for helping students understand this distinction. Answers frequently asked questions about

evolution. *Teaching About Evolution and the Nature of Science* builds on the 1996 National Science Education Standards released by the National Research Council--and offers detailed guidance on how to evaluate and choose instructional materials that support the standards. Comprehensive and practical, this book brings one of today's educational challenges into focus in a balanced and reasoned discussion. It will be of special interest to teachers of science, school administrators, and interested members of the community.

**How Forests Think** W. W. Norton

*Exploring Physical Anthropology* is a comprehensive, full-color lab manual intended for an introductory laboratory course in physical anthropology. It can also serve as a supplementary workbook for a lecture class, particularly in the absence of a laboratory offering. This laboratory manual enables a hands-on approach to learning about the evolutionary processes that resulted in humans through the use of numerous examples and exercises. It offers a solid grounding in the main areas of an introductory physical anthropology lab course: genetics, evolutionary forces, human osteology, forensic anthropology, comparative/functional skeletal anatomy, primate behavior, paleoanthropology, and modern human biological variation.

*Discovering Physical Anthropology* by Clark Larsen, ISBN Simon and Schuster Volume detailing the effects of the molecular revolution on anthropological genetics and how it redefined the field. Essentials of Biological Anthropology Profile Books

Anthropology is the study of all humans in all times in all places. But it is so much more than that. "Anthropology requires strength, valor, and courage," Nancy

Scheper-Hughes noted. "Pierre Bourdieu called anthropology a combat sport, an extreme sport as well as a tough and rigorous discipline. ... It teaches students not to be afraid of getting one's hands dirty, to get down in the dirt, and to commit yourself, body and mind. Susan Sontag called anthropology a "heroic" profession." What is the payoff for this heroic journey? You will find ideas that can carry you across rivers of doubt and over mountains of fear to find the light and life of places forgotten. Real anthropology cannot be contained in a book. You have to go out and feel the world's jagged edges, wipe its dust from your brow, and at times, leave your blood in its soil. In this unique book, Dr. Michael Wesch shares many of his own adventures of being an anthropologist and what the science of human beings can tell us about the art of being human. This special first draft edition is a loose framework for more and more complete future chapters and writings. It serves as a companion to anth101.com, a free and open resource for instructors of cultural anthropology. This 2018 text is a revision of the "first draft edition" from 2017 and includes 7 new chapters. *Anthropology 4th Edition* Birkhäuser

The city is more than demography and architecture, it is a state of mind. Various groups, scenes and subcultures, widely known as "man in the street", shape and are shaped by urban space and its history according to imaginations, nightmares and dreams. Urban anthropologists get immersed in this closely knit fabric of urban culture and conduct field research with all their senses. The reader provides a compact introduction into urban anthropology, which has become the key discipline in exploring cities and city life as sites of encounter, conflict and sensation. It

introduces the most influential writers in the field as well as young and upcoming field researchers. With essays by Peter Jackson, Les Back, Ruth Behar, Moritz Ege, Rolf Lindner, Mirko Zardini, Margarethe Kusenbach, Loic Wacquant. *The Quest for the Origins of Human Life* W. W. Norton

This textbook presents a survey of physical anthropology, the branch of anthropology that studies the physical development of the human species. It plays an important part in the study of human origins and in the analysis and identification of human remains for legal purposes. It draws upon human body measurements, human genetics, and the study of human bones and includes the study of human brain evolution, and of culture as neurological adaptation to environment. The authors use the progressive term "biological anthropology" to mean "an integrative combination of information from the fossil record and the human skeleton, genetics of individuals and of populations, our primate relatives, human adaptation, and human behavior."

[A Hundred Years of Anthropology](#)

Springer Science & Business Media

History of Anthropology is a series of annual volumes, inaugurated in 1983, each broadly unified around a theme of major importance to both the history and the present practice of anthropological

inquiry. *Bones, Bodies, Behavior*, the fifth in the series, treats a number of issues relating to the history of biological or physical anthropology: the application of the "race" idea to humankind, the comparison of animals minds to those of humans, the evolution of humans from primate forms, and the relation of science to racial ideology. Following an introductory overview of biological anthropology in Western tradition, the seven essays focus on a series of particular historical episodes from 1830 to 1980: the emergence of the race idea in restoration France, the comparative psychological thought of the American ethnologist Lewis Henry Morgan, the archeological background of the forgery of the remains "discovered" at Piltdown in 1912, their impact on paleoanthropology in the interwar period, the background and development of physical anthropology in Nazi Germany, and the attempts of Franx Boas and others to organize a consensus against racialism among British and American scientists in the late 1930s. The volume concludes with a provocative essay on physical anthropology and primate studies in the United States in the years since such a consensus was established by the UNESCO "Statements on Race" of 1950 and 1951. Bringing together the contributions of a physical anthropologist (Frank Spencer), a historical sociologist (Michael Hammond), and a number of historians of science (Elazar Barkan, Claude Blanckaert, Donna Haraway, Robert Proctor, and Marc Swetlitz), this volume will appeal to a wide range of students, scholars, and general readers interested in the place of biological assumptions in the modern anthropological tradition, in the biological bases of human behavior,

in racial ideologies, and in the development of the modern human sciences.

In this stunningly original book, Richard Wrangham argues that it was cooking that caused the extraordinary transformation of our ancestors from apelike beings to *Homo erectus*. At the heart of *Catching Fire* lies an explosive new idea: the habit of eating cooked rather than raw food permitted the digestive tract to shrink and the human brain to grow, helped structure human society, and created the male-female division of labour. As our ancestors adapted to using fire, humans emerged as "the cooking apes". Covering everything from food-labelling and overweight pets to raw-food faddists, *Catching Fire* offers a startlingly original argument about how we came to be the social, intelligent, and sexual species we are today. "This notion is surprising, fresh and, in the hands of Richard Wrangham, utterly persuasive ... Big, new ideas do not come along often in evolution these days, but this is one." - Matt Ridley, author of *Genome*  
[Unearthing the Astonishing New Story of How We Became Human](#) John Wiley & Sons

Africa does not give up its secrets easily. Buried there lie answers about the origins of humankind and the dawn of civilisation. Through a century of archaeological investigation, scientists have transformed our understanding of the beginnings of human life, although vital clues still remain hidden. In *Born in Africa*, Martin Meredith follows the trail of discoveries about our human origins made by scientists over the last hundred years, as well as describing the history of scholarship in this incredibly exciting field. He relates the intense rivalries,

personal feuds and fierce controversies that shaped the study and perception of Africa, and recounts the feats of skill and endurance that have illuminated thousands of years of human evolution. The results have been momentous. Scientists have identified more than twenty species of extinct humans and firmly established Africa as the birthplace not only of humankind, but also of our own species: homo sapiens, the modern human. Scientific study has revealed how early technology, language ability and artistic endeavour all originated in Africa, and scientists have shown how, in an exodus sixty thousand years ago, small groups of Africans left their birthplace to populate the rest of the world. We all have an African legacy, and in this fascinating and informative book Martin Meredith leads us back to the place where we have rediscovered our common human heritage.
