There is an implication that individuals who are bullied must have "asked

for" this type of treatment, or deserved it. Sometimes, even the child who is bullied begins to internalize this idea. For many years, there has been a general acceptance and collective shrug when it comes to a child or adolescent with greater social capital or power pushing around a child perceived as subordinate. But bullying is not developmentally appropriate; it should not be

considered a normal part of the typical social grouping that occurs throughout a child's life. Although bullying behavior endures through generations, the milieu is changing. Historically, bullying has occurred at school, the physical setting in which most of childhood is centered and the primary source for peer group formation. In recent years, however, the physical

setting is not the only place bullying is occurring. Technology allows for an entirely new type of digital electronic aggression, cyberbullying, which takes place through chat rooms, instant messaging, social media, and other forms of digital electronic communication. Composition of peer groups, shifting demographics, changing societal norms, and modern

technology are contextual factors that must be considered to understand and effectively react to bullying in the United States. Youth are embedded in multiple contexts and each of these contexts interacts with individual characteristics of youth in ways that either exacerbate or attenuate the association between these individual characteristics and bullying perpetration or victimization.

Recognizing that bullying behavior is a major public health problem that demands the concerted and coordinated time and attention of parents, educators and school administrators, health care providers, policy makers, families, and others concerned with the care of children, this report evaluates the state of the science on biological and psychosocial consequences of peer victimization

and the risk and protective factors that either increase or decrease peer victimization behavior and consequences

From birth, children are

learning and rely on parents and the other caregivers in their lives to protect and care for them. The impact of parents may never be greater than during the earliest years of life, when a child's brain is rapidly developing and when nearly all of her or his experiences are created and shaped by parents and the family environment. Parents help children build and refine their knowledge

and skills, charting a trajectory for their health and well-being during childhood and beyond. The experience of parenting also impacts parents themselves. For instance, parenting can enrich and give focus to parents' lives; generate stress or calm; and create any number of emotions, including feelings of happiness, sadness, fulfillment, and anger. Parenting of young children today

takes place in the context of significant ongoing developments. These include: a rapidly growing body of science on early childhood, increases in funding for programs and services for families, changing demographics of the U.S. population, and greater diversity of family structure. Additionally, parenting is increasingly being shaped by technology and increased access to information

about parenting. Parenting Matters identifies parenting knowledge, attitudes, and practices associated with positive developmental outcomes in children ages 0-8; universal/preventive and targeted strategies used in a variety of settings that have been effective with parents of young children and that support the identified knowledge, attitudes, and practices; and

barriers to and facilitators for parents' use of practices that lead to healthy child outcomes as well as their participation in effective programs and services. This report makes recommendations directed at an array of stakeholders, for promoting the wide-scale adoption of effective programs and services for parents and on areas that warrant further research to inform policy and practice. It is meant to serve as a

roadmap for the future of parenting policy, research, and practice in the United States. One of the largest and most complex human services systems in Western nations has evolved to address the needs of people with developmental disabilities. In the U.S., for example, school budgets are stretched thin by legally

mandated special education, and billions of Medicaid dollars annually are consumed by residential and professional services to this population.

The temptation of a quick fix is strong. Many parents desperately seek the latest ideas and place pressure on program administrators, who often are not trained to think critically about the evidence base for

intervention efforts. The problems of people with developmental disabilities have historically been targeted by a wide range of professionals who rely on clinical experience and intuition and do not submit their claims to the tests of scientific research. Professional entrepreneurs have energetically promoted their treatments to a public perhaps too trustful of

those with credentials. Thus, families and their children are buffeted by reforms founded on belief and ideologically driven management. Services fluctuate with the currents of social movements and rapidly shifting philosophies of care as policymakers and providers strive for increased responsiveness and individualization. These forces affect not only where and

how, but how well people are served. Too often, services are less effective than they could be, or worse, damaging to personal growth and quality of life. Many treatments are based on poorly understood or even disproven approaches. What approaches to early intervention, education, therapy, and remediation really help those with mental retardation

and developmental disabilities improve their functioning and adaptation? And what approaches represent wastes of time, effort, and resources? This book brings together leading behavioral scientists and practitioners to focus light on the major controversies surrounding these questions. The authors review the origins, perpetuation, and resistance

to scrutiny of questionable practices, and offer a clear rationale for appraising the quality of services. In an era of increasing accountability, no one with a professional stake in services to individuals with mental retardation and developmental disabilities can afford not to read this book.
