<i>Engineering Materials and Metallurgy</i> Icon Learning Systems Llc Die Digitalisierung von Prozessen und Maschinen und deren Ausstattung mit Sensoren und Konnektivität ermöglichen es den Maschinen- und Anlagenbauern, neuartige, datengetriebene und intelligente Dienstleistungen, sog. Smart Services, anzubieten und darauf basierend neue Geschäftsmodelle zu entwickeln. Jedoch besteht eine Unklarheit darüber, wie neue Geschäftsmodelle im Bereich Smart Services erarbeitet und monetarisiert werden können. Daher beschreibt Sabrina Gerl eine systematische und konkrete Vorgehensweise zur Entwicklung innovativer Geschäftsmodelle für industrielle Smart Services. Im Fokus ihres neuen Ansatzes steht eine Fallsammlung mit Smart Services im Maschinenbau sowie das Smart Service-Ideen-Canvas, mithilfe dessen neue Ideen für Smart Services hervorgebracht werden können. Die Autorin: Sabrina Gerl arbeitet seit dem erfolgreichen Abschluss ihres Masterstudiums in International Management an der Hochschule Karlsruhe im globalen Einkauf eines führenden Softwareherstellers.	
<i>GOLDEN COMMON LISP</i> John Wiley & Sons Additive manufacturing (AM) is one of the manufacturing processes that warrants the attention of industrialists, researchers, and scientists. AM has the ability to fabricate materials to produce parts with complex shapes without any theoretical restrictions combined with added functionalities. Selective laser melting (SLM), also known as laser-based powder bed processing (LPBF), is one of the main AM process that can be used to fabricate wide variety of materials that are Al-, Ti-, Fe-, Ni-, Co-, W-, Ag-, and Au-based, etc. However, several challenges need to be addressed systematically, such as development of new materials that suit the SLM process conditions so the process capabilities can be fully used to produce new properties in these materials. Other issues in the field are the lack of microstructure-property correlations, premature failure, etc. Accordingly, this Special Issue (book) focuses mainly on the microstructure-correlation in three different alloys: AlSi10Mg, Ti6Al4V, and 304L stainless steel, where six articles are presented. Hence, this Special Issue outlines microstructure-property correlations in the SLM processed materials and provides a value addition to the field of AM.

SystemVerilog is a Hardware Description Language that enables designers to work at the higher levels of logic design abstractions that match the increased complexity of current day integrated circuit and field-programmable gate array (FPGA) designs. The majority of the book assumes a basic background in logic design and software programming concepts. It is directed at: * students currently in an introductory logic design course that also teaches SystemVerilog, * designers who want to update their skills from Verilog or VHDL, and * students in VLSI design and advanced logic design courses that include verification as well as design topics. The book starts with a tutorial introduction on hardware description languages and simulation. It proceeds to the register-transfer design topics of combinational and finite state machine (FSM) design - these mirror the topics of introductory logic design courses. The book covers the design of FSM-datapath designs and their interfaces, including SystemVerilog interfaces. Then it covers the more advanced topics of writing testbenches including using assertions and functional coverage. A comprehensive index provides easy access to the book's topics.The goal of the book is to introduce the broad spectrum of features in the language in a way that complements introductory and advanced logic design and verification courses, and then provides a basis for further learning.Solutions to problems at the end of chapters, and text copies of the SystemVerilog examples are available from the author as described in the Preface.

Heat exchanger has increased immensely from the viewpoint of energy conservation, conversion, recovery, and successful implementation of new energy sources. Its importance is also increasing from the stand-point of environmental concerns such as thermal pollution, air pollution, water pollution, and waste disposal. Heat exchangers are used in the process, power, transportation, air-conditioning and refrigeration, cryogenic, heat recovery; alternate fuels, and manufacturing industries, as well as being key components of many industrial products available in the marketplace.

The heat exchanger design equation can be used to calculate the required heat transfer surface area for a variety of specified fluids, inlet and outlet temperatures and types and configurations of heat exchangers, including counterflow or parallel flow. A value is needed for the overall heat transfer coefficient for the given heat exchanger, fluids, and temperatures. Heat exchanger calculations could be made for the required heat transfer area, or the rate of heat transfer for a heat exchanger of given area.
