The research literature suggests that GPA, along with previously taken college courses, is a better predictor of success of student graduation than any simple measure. The purpose of this casual comparative study was to investigate whether students with prior college experience selecting a military career were better prepared for challenges in military schools than those students who have had no previous college experience. The research was conducted at the Naval School of Health Sciences in San Diego, California, located on the grounds of Naval Medical Center San Diego, California from May 2004 to August 2005. The questionnaire required students to indicate their responses to three questions. Each student (N=50) from two different classes was administered the questionnaire. The return rate was 100%. The study found that there was no difference in grade point average (GPA) of military students with and without prior college experience who were enrolled in the Navy's Medical Laboratory Technician program from May 2004 to August 2005. It was concluded that Navy's policy on requiring students to have certain college prerequisites may not necessarily impact their success in the MLT program.

Hospitals are experiencing a labor shortage of qualified laboratory professionals. Multiple problems have contributed to this issue including a reduction in the number of clinical laboratory science programs nationwide. One way to address the shortage is by increasing the number of distance programs within the clinical laboratory sciences. The purpose of this study was to examine motivating and inhibiting factors impacting clinical laboratory science program directors' decision to use distance education. Of 467 clinical laboratory science program directors listed on a national registry, 163 responded to an online survey utilizing a four-point Likert scale. Results indicated directors are motivated by intrinsic factors centered around the concept of flexibility. Directors with distance education experience were intrinsically motivated by students-centered factors, while directors without experience were intrinsically motivated by personal-centered factors. Several significant differences existed between group comparisons of inhibitors for directors with and without experience and when divided into programmatic setting creating three groups: medical laboratory science program directors in university settings, medical laboratory technician program directors in technical college settings, and hospital-based program directors. Directors without experience and those hospital-based found more factors to be inhibiting.
