The aim of this atlas is to guide pathologists and radiologists in the accurate triage and diagnosis of deep seated mass lesions biopsied under ultrasound, CT Scan or fluoroscopic guidance. Fine needle aspiration cytology has become the foremost diagnostic modality in recent years for the diagnosis of mass lesions, including primary and recurrent neoplasms and masses of non-neoplastic and infectious etiology. An essential requirement in the accurate diagnosis of these masses is the correlation of cytomorphology with the radiological findings and adequate triage of acquired material during the biopsy procedure. The cytologic appearance (fine needle aspiration smears, touch preparations, cell blocks and core biopsy), gross surgical resected specimen (where available on follow-up) and imaging findings will be illustrated to provide a complete pathologic-radiologic correlation of the entities discussed. Collection methods and correlation with ancillary studies such as flow cytometry, microbiologic cultures, cytogenetics and immunohistochemistry will be described. The importance of specimen type and cytologic and radiologic techniques will be emphasized.

“This is a “must need” for any cytology laboratory performing touch preparations as part of their service or those wanting to offer this to their physicians as an alternative approach to the standard FNA or frozen section... and [it] would be a great addition to your reference library.”---The ASC Bulletin This is the first atlas dedicated to touch preparation cytopathology. Written by established pathologists who are at the cutting edge of this minimally-invasive practice, the Atlas of Touch Preparation Cytopathology presents a comprehensive overview and visual reference guide to the diagnostic applications of touch preparations. This visually-stunning book reviews touch preparations corresponding to all major body systems and includes chapters on specimen handling and processing, intraoperative use during frozen sections, as well as on ancillary testing using touch preps. While most cytopathology atlases have images of smears and fluids, they have very little discussion of touch preparations making this volume a one-of-a-kind resource. The authors, using many picturesque examples in the text, not only include detailed visual and textual discussion of touch preparations but also provide comparative presentations to facilitate correlation with histopathology, FNA smears and ancillary test results. This total coverage illuminates key findings and important considerations of this technique that pathologists can learn from. Written with the practicing pathologist in mind, the Atlas of Touch Preparation Cytopathology is an invaluable book in today’s pathology practice where there is increasing utilization of small biopsies that can benefit from intraprocedural evaluation and assessment to maximize diagnostic yield. Key Features: Covers various methods of touch preparation and addresses measures to avoid pitfalls. Includes techniques that can serve as helpful tricks during intraprocedural evaluation of small biopsies and at the time of frozen section. Comprehensive coverage of different body systems that are typically sampled with small biopsies and amenable to touch preparations. Contains over 400 touch preparation images and includes corresponding histopathologic figures and ancillary studies.

Atlas of Anatomic Pathology with Imaging - A Correlative Diagnostic Companion is a valuable teaching tool for medical students and residents in several specialties such as pathology, radiology, internal medicine, surgery and neurologic sciences. Its need is all the more urgent given the severe shortcuts in the teaching of anatomic pathology following the decrease in the number of autopsies performed. Many of the images shown in the atlas would not be available without performing autopsies and therefore this atlas is an essential for all those in the field. Atlas of Anatomic Pathology with Imaging - A Correlative Diagnostic Companion is the first to combine gross anatomic pictures of diseases with diagnostic imaging. This unique collection of material consisting of over 2000 illustrations compiled by experts from around the world is a valuable diagnostic resource for all medical professionals.

This richly illustrated book will help presurgically diagnose pediatric/young adult tumors. The content is divided into two parts. The first part shows step-by-step how to perform a small volume specimen such as fine needle aspiration/core needle biopsy and how to correlate the morphology with the clinical, radiological, and/or molecular information. In turn, the second part presents a comprehensive overview of the various tumor entities. The content represents diagnostic modalities from the major diagnostic centers worldwide, and is supplemented by the authors’ 25 years of experience in diagnosing pediatric tumors. This book will successfully guide practitioners, researchers and oncology pediatricians through the process of sample harvesting and diagnosing. Pediatric tumors represent a large variety of lesions including pseudotumors of inflammatory and non-inflammatory origin, various types of lymphadenopathy, benign lesions, specific sarcomas, and blastemal malignancies. These age-specific and histotype-specific tumors of various origin, evolution and prognosis are often characteristic in morphological and molecular levels, making their diagnosis highly specialized.

Cytology is a unique subspecialty in anatomic pathology, and plays a critical role in the diagnosis of a variety of benign and malignant lesions by using minimally invasive procedures, such as fine needle aspiration, brushing, washing and lavage. Cytology not only provides an accurate diagnosis of the lesion based on the cytomorphological evaluation at cellular level, but also provides material for molecular characterization of a tumor for targeted therapy. In the era of personalized medicine, cytology has continued to grow and evolve as an important diagnostic tool. For example, some types of procedures are routinely used, diagnostic criteria have become more refined, and certain terminology has been changed based on current WHO classifications. Therefore, it is necessary to update our knowledge and terminology in cytology. In this volume, we have retained the quality and the clarity of the series, and like the other volumes, this volume aims to be concise and comprehensive yet clinically relevant to daily practice. Although this volume is written by multiple authors, all chapters follow a similar format: brief introduction of the specific organ/system (including types of specimens and techniques to obtain samples), description of normal findings, and a practice approach to diagnose benign and malignant lesions. In each chapter, the key cytomorphological feature and main differential diagnoses of the lesion are summarized in a concise table. Images in each chapter are instructive and clearly represent findings. Where necessary, we have also illustrated the important ancillary tests, such as flow cytometry, immunohistochemistry and molecular analysis, which are crucial for an accurate diagnosis and targeted therapy. The updated knowledge, including key cytomorphological features, current terminology and molecular diagnostic tests, is the highlight of this volume.
