A Brief History of Time and the Universe in a Nutshell Oxford University Press

At one magical instant in your early childhood, the page of a book—that string of confused, alien ciphers—shivered into meaning, and at that moment, whole universes opened. You became, irrevocably, a reader. Noted essayist and editor Alberto Manguel moves from this essential moment to explore the six-thousand-year-old conversation between words and that hero without whom the book would be a lifeless object: the reader. Manguel brilliantly covers reading as seduction, as rebellion, and as obsession and goes on to trace the quirky and fascinating history of the reader's progress from clay tablet to scroll, codex to CD-ROM.

Stephen Hawking, the Lucasian Professor of Mathematics at Cambridge University, has made important theoretical contributions to gravitational theory and has played a major role in the development of cosmology and black hole physics. Hawking's early work, partly in collaboration with Roger Penrose, showed the significance of spacetime singularities for the big bang and black holes. His later work has been concerned with a deeper understanding of these two issues. The work required extensive use of the two great intellectual achievements of the first half of the Twentieth Century: general relativity and quantum mechanics; and these are reflected in the reprinted articles. Hawking's key contributions on black hole radiation and the no-boundary condition on the origin of the universe are included. The present compilation of Stephen Hawking's most important work also includes an introduction by him, which guides the reader through the major highlights of the volume. This volume is thus an essential item in any library and will be an important reference source for those interested in theoretical physics and applied mathematics. It is an excellent thing to have so many of Professor Hawking's most important contributions to the theory of black holes and space-time singularities all collected together in one handy volume. I am very glad to have them". Roger Penrose (Oxford) "This was an excellent idea to put the best papers by Stephen Hawking together. Even his papers written many years ago remain extremely useful for those who study classical and quantum gravity. By watching the evolution of his ideas one can get a very clear picture of the development of quantum cosmology during the last quarter of this century". Andrei Linde (Stanford) "This review could have been quite short: 'The book contains a selection of 21 of Stephen Hawking's

most significant papers with an overview written by the author'. This w

Financial crises happen time and again in post-industrial economies—and they are extraordinarily damaging. Building on insights gleaned from many years of work in the banking industry and drawing on a vast trove of data, Richard Vague argues that such crises follow a pattern that makes them both predictable and avoidable. *A Brief History of Doom* examines a series of major crises over the past 200 years in the United States, Great Britain, Germany, France, Japan, and China—including the Great Depression and the economic meltdown of 2008. Vague demonstrates that the over-accumulation of private debt does a better job than any other variable of explaining and predicting financial crises. In a series of clear and gripping chapters, he shows that in each case the rapid growth of loans produced widespread overcapacity, which then led to the spread of bad loans and bank failures. This cycle, according to Vague, is the essence of financial crises and the script they

invariably follow. The story of financial crisis is fundamentally the story of private debt and runaway lending. Convinced that we have it within our power to break the cycle, Vague provides the tools to enable politicians, bankers, and private citizens to recognize and respond to the danger signs before it begins again.

“It is said that fact is sometimes stranger than fiction, and nowhere is that more true than in the case of black holes. Black holes are stranger than anything dreamed up by science fiction writers.” In 2016 Professor Stephen Hawking delivered the BBC Reith Lectures on a subject that fascinated him for decades - black holes. In these flagship lectures the legendary physicist argued that if we could only understand black holes and how they challenge the very nature of space and time, we could unlock the secrets of the universe.
