The American Heritage Science Dictionary IGI Global

Information science is the study of information phenomena, including the acquisition, storage, and manipulation of data, information, and knowledge. It is by nature an interdisciplinary field. Researchers, managers, system users, and students need access to tools, terms, and techniques that are spread out over a large literature in a number of different disciplines: information retrieval, database management, office information systems, information technology, communication and networking, relevant computer hardware, and artificial intelligence. This work facilitates the cross-use terms from the various contributing sub-areas of information science. With definitions of one-thousand terms, in alphabetical order, the volume provides a unified, integrated, and concise guide to the field. Each term is annotated by one or more references to the literature. Where possible, the first reference directs the user to a basic or seminal discussion of the term and subsequent references show its usage in an information science-related application. This work will be an indispensable reference for students, researchers, and professionals. Contains one-thousand entries and more than 100 illustrations and tables Many entries include enough information (examples, diagrams, and formulas) to allow the reader to make use of the term, model, or algorithm in his or her own application An extensive bibliography (more than 300 references) guides the reader to the details of concepts described in the guide--nearly every entry is annotated by one or more references, both to seminal or basic discussions of the concept and to works that demonstrate its usage in an information science-related application Each term is followed by a number "key" into the detailed subject outlines at the back of the book, so that each item is given a context within a subject area Entries focus on fundamental concepts, rather than specific technologies

The Computer and Information Science and Technology Abbreviations and Acronyms Dictionary Gyan Publishing House

More and more industrial and economic activities are now carried out with the help of computers. Owing to its integrative character, informatics has turned out to be the decisive basic science in laying the foundations for the effective use of computer technology in all areas. It is especially owing to the microcomputer that information-processing technology has entered all areas of life and can solve tasks on an undreamt-of scale. Software development has been speeded up by the use of scientific methods, techniques and aids of informatics such as more effective programming languages, software engineering and documentation. As a result, informatics has gained in importance as a basic subject matter in secondary schools, colleges and universities. This dictionary has been compiled with all these developments and trends in mind and by making use of the appropriate international scientific literature in the original languages, especially books and journals in English, Russian, German and French, dealing with the state of the art and further development of informatics and applied computer science and engineering. It covers the general fundamentals of informatics such as computer architecture; hardware and software components; systems engineering; interactive and batch processing; fundamentals of software development (programming) such as conceptual formulation, program implementation, data acquisition and data management; hardware components such as circuits, memories, input/output devices, interfaces, data acquisition terminals, sensors and actuators; transmission media and network controllers; system reliability; applications of informatics in industry and economics such as CIM, CAD, CAM, artificial

intelligence, expert systems and databases. The alphanumerical organisation of the entries enables the reader to translate from any one to any other of the four featured languages, by using the indexes. This four-language reference book has been developed particularly for specialized scientists and engineers working in informatics. It should be of value to lecturers and students at universities, technical and engineering colleges, and other schools of higher education where informatics is being studied, and will also serve as a useful tool for translators and documentalists.
