Kids often suffer unknowingly from the consequences of sleep problems because their issue is frequently missed or dismissed, by both health professionals and parents. Sleep disorders are a major public health issue that can kick start a lifetime pattern of health, behaviour, and learning problems. From ages 4-10, at least 25 percent of kids have sleep problems. Sleep Wrecked Kids guides parents towards good sleep as the norm, allowing themselves and their children to grow and thrive. Speech pathologist and myofunctional practitioner Sharon Moore teaches parents why 'bad sleep' is connected to a myriad of health problems, what 'good sleep' actually means, how to identify red flags for sleep problems, how to improve sleep quality by improving airway health, and so much more! Parents are empowered to not only get more sleep themselves, but also to help their children get the sleep they need—every night.

Motor speech disorders are a common accompaniment of a whole range of neurological conditions, from stroke, brain injury and Parkinson's disease through to many rarer conditions. This book aims to aid understanding of the nature of motor speech disorders from a cross-language perspective, in contrast to the largely English-centric nature of research and practice recommendations to date. The book looks not just at how these motor speech disorders are assessed and treated in other countries, but also examines how underlying speech impairments differ according to the language someone speaks. The book studies the underlying neurological, neurophysiological and neurophonetic characteristics of motor speech disorders in different language contexts, and discusses the implications these have for clinical rehabilitation. This significantly adds to debates around the theoretical understanding and clinical management of motor speech disorders.

**Management of Swallowing and Feeding Disorders in Schools** examines the most significant issues in swallowing and feeding facing school-based speech-language pathologists (SLPs). Topics addressed are unique to the school setting, ranging from organizing a team procedure in a district

to serving children with complex medical issues, behavioral feeding disorders, and neurological feeding disorders. Ethical, legal, and cultural issues are also addressed. Many students in school districts across the country exhibit the signs and symptoms of dysphagia, and children who were originally treated for dysphagia in hospitals and other settings often begin attending public schools at three years old. The difficulty they had with swallowing and feeding frequently follows them to the school setting. Further, there are many students who develop swallowing and feeding disorders as a result of traumatic brain injury, neurological disorders and syndromes, behavioral disorders, and so forth. The range of students needing services for swallowing and feeding disorders in the school setting can be from three to twenty-two years of age and from mild dysphagia to tube feeding. The identification and treatment of swallowing and feeding disorders in schools is relatively new. There are still many districts in the country and internationally that do not address the needs of children with dysphagia. As school-based SLPs take on the challenge of this population there is a need for information that is current, accurate, and thorough. University programs include very little training, if any, at this time in the area of swallowing and feeding in the school setting. This text is appropriate for both a dysphagia course as well as courses that train SLP students to work with school-aged students.

People with Down Syndrome show a specific developmental profile with strengths in social understanding and visual learning and memory, and more difficulties with motor processes, speech and language, and auditory-vocal short-term memory. It is important that parents, practitioners and teachers know this and adapt interventions and educational approaches to take account of this particular profile. This is the only book to date that explains the developmental profile of people with Down Syndrome from its many different angles. It covers a range of perspectives, including the biology, psychology, speech and language, health care, and social competence of both children and adults with Down Syndrome. All the information is gathered and placed in the context of the neuro-genetic science that is developing around this area.
