(Key topics: organic chemistry, hydrocarbons, black gold, benzene, organic acids, ethers, plastics, alcohol, changing molecules, carbohydrates, nitrogen compounds, fibers, vitamins, protein, colloids, Pasteur, Baekeland, Eijkman) IPC consists of twelve chapters of text and twelve companion student activity books. This course introduces students to the people, places and principles of physics and chemistry. It is written by internationally respected scientist/author, John Hudson Tiner, who applies the vignette approach which effectively draws readers into the text and holds attention. The author and editors have deliberately avoided complex mathematical equations in order to entice students into high school level science. Focus is on the people who contributed to development of the Periodic Table of the Elements. Students learn to read and apply the Table while gaining insight into basic chemistry and physics. This is one of our most popular courses among high school students, especially those who have a history of under-performance in science courses due to poor mathematical and reading comprehension skills. The course is designed for two high school transcript credits. Teachers may require students to complete all twelve chapters for two transcript credits or may select only six chapters to be completed for one transcript credit for Physical Science, Physics, or Chemistry. Compliance with state and local academic essential elements should be considered when specific chapters are selected by teachers. As applicable to local policies, transcript credit may be assigned as follows when students complete all 12 chapters: Physical Science for one credit and Chemistry for one credit, or Integrated Physics and Chemistry for two credits. (May require supplemental local classes/labs.)

This unique collection shows what happens when one university takes on the challenge of developing the scholarship of teaching and learning with a view to enhancing students' learning experiences. Authors from the sciences, engineering, humanities and social sciences, and from the health sciences, demonstrate the research they have done to investigate their students' learning. The editors, Angela Brew and Judyth Sachs, have captured the intricacies of teaching and learning in different academic domains in this rich and varied collection. The book explores students' responses to contemporary art, to multicultural music and to architecture for the poor and dispossessed. It explores students' ability to transfer mathematical knowledge from one subject to another; how students learn to talk like a pharmacist, or understand basic concepts in physics; how students are prepared for university study in first year classes or in the operating theatre; how they learn to write like a scientist; how they learn in online discussions and how they understand group work and group assessment. Each chapter is grounded in rigorous research and scholarship and indicates actions that have been taken to improve teaching and students' learning. This book is a remarkable demonstration of scholarly teaching practice from a single institution. It should be read by all teachers and managers in higher and tertiary education institutions interested in developing teaching and learning.

The Scholarship of Teaching and Learning in Practice Oswal Publishers

This book examines the birth of the scientific understanding of motion. It investigates which logical tools and methodological principles had to be in place to give a consistent account of motion, and which mathematical notions were introduced to gain control over conceptual problems of motion. It shows how the idea of motion raised two fundamental problems in the 5th and 4th century BCE: bringing together being and non-being, and bringing together time and space. The first problem leads to the exclusion of motion from the realm of rational investigation in Parmenides, the second to Zeno's paradoxes of motion. Methodological and logical developments reacting to these puzzles are shown to be present implicitly in the atomists, and explicitly in Plato who also employs mathematical structures to make motion intelligible. With Aristotle we finally see the first outline of the fundamental framework with which we conceptualise motion today.
