The use of injectables, known as dermal fillers, is becoming ever more popular in aesthetic medicine. Full-face and full-body treatments using such fillers are increasingly substituting for various surgical techniques; not only do they provide immediate results at a lower cost, but they also avoid the use of general anesthesia and shorten the recovery period. In addition, dermal fillers can be successfully used for body remodeling, for example in patients with bow legs and those requiring breast remodeling. This book outlines the fundamental principles of the use of different fillers and injection techniques in the treatment of facial and body areas. An impressive collection of sequential color photographs illustrate the procedures step by step and demonstrate the results. The volume will be an invaluable tool for aesthetic doctors, practicing dermatologists, plastic surgeons, and all other physicians interested in the field of aesthetic medicine.

John Wiley & Sons  
A Practical Guide to Botulinum Toxin Procedures is one of four books in the new Cosmetic Procedures for Primary Care series. This series offers guidance to primary care practitioners who wish to expand their practice to minimally invasive cosmetic procedures. Whether the physician is just getting started or well versed in aesthetic medicine, this series can be used as a routine quick reference for current aesthetic procedures that can be readily incorporated into office practice. A number of scar revision techniques can be utilized to treat specific types of scars, in combination with each other or with adjunctive therapies to achieve optimal results. Pathological conditions like hypertrophic scars and keloids are still challenging. Though a number of therapies exist to treat keloids, such as intralesional steroids and anti-metabolites, cryosurgery, to name a few, none are definitive in treatment. Understanding the molecular basis of keloids may lead to development of new therapies. Striae, also known as 'stretch marks', are extremely common, disfiguring and a real challenge to treat. Management of striae is a neglected field of research. Except for topical retinoids, the efficacy satisfactorily. Current treatment options include chemical peels, lasers and collagen induction therapy, with a tendency towards active intervention. However, studies are necessary to determine treatment strategies which produce results that are effective with minimal adverse effects. Post-acne scarring is one of the most common causes of facial scars, causing considerable cosmetic disability. Acne is a common skin disorder, unfortunately affecting a large number of teenagers. Usually patients have a combination of different types of scars; hence no single modality is useful. A combination of procedures is generally required for a satisfactory cosmetic outcome. The use of fractional lasers is gaining importance, as it is a minimally invasive procedure as compared to aggressive resurfacing procedures of the past. Collagen induction therapy is another promising technique. Today, patients are also getting up-to-date information about the various modalities available for scar treatment through media, such as magazines, advertisements and internet. However, exaggerated advertisements and information from nonprofessional sources, particularly with regard to lasers can influence patient expectations and result in unrealistic expectations. Patients need to understand that deep scars cannot be eliminated fully and can only be improved. They usually have high expectations from procedural techniques. Proper counseling is extremely important for a happy and satisfactory outcome. Current innovations and techniques in scar

prevention and management and increasing use of minimally invasive surgeries are paving the way toward smoother, less noticeable scars. Every surgeon practicing aesthetics should be well versed with modalities of scar management and this is the aim of this clinical update.
