Legionnaires' disease, a

pneumonia caused by the

Legionella bacterium, is

the leading cause of

reported waterborne

disease outbreaks in the

United States. Legionella

occur naturally in water

from many different

environmental sources,

but grow rapidly in the

warm, stagnant conditions

that can be found in

engineered water systems

such as cooling towers,

building plumbing, and

hot tubs. Humans are

primarily exposed to

Legionella through

inhalation of

contaminated aerosols

into the respiratory

system. Legionnaires'

disease can be fatal, with

between 3 and 33 percent

of Legionella infections

leading to death, and

studies show the

incidence of Legionnaires'

disease in the United

States increased five-fold

from 2000 to 2017.

Management of Legionella

in Water Systems reviews

the state of science on

Legionella contamination of water systems, specifically the ecology and diagnosis. This report explores the process of transmission via water systems, quantification, prevention and control, and policy and training issues that affect the incidence of Legionnaires' disease. It also analyzes existing knowledge gaps and recommends research priorities moving forward.
