An example of this is given in table 9.1 in which injuries are compared in two dropping zones. This is subject to potential biases in that the reason why a person is allocated to a particular dropping zone may be related to their risk of a sprained ankle.¹³ Study design and choosing a statistical test | The BMJ The Experimental Design Process. Research Methods Experimental Design Experimental Design. By Saul McLeod, updated 2017. Experimental design refers to how participants are allocated to the different groups in an experiment. Types of design include repeated measures, independent groups, and matched pairs designs. Probably the commonest way to design an experiment in psychology is to divide the participants into two groups, the experimental group, and the control group, and then introduce a change to the experimental group and not the control group. Most designs given in this chapter involve testing by analysis of variance (ANOVA). The chapter covers basic material by detailing the nature and terminology of experimental design for simple experiments. Experimental Design - Statistical Methods for Food Science ... The design of experiments is the design of any task that aims to describe and explain the variation of information under conditions that are hypothesized to reflect the variation. The term is generally associated with experiments in which the design introduces conditions that directly affect the variation, but may also refer to the design of quasi-experiments, in which natural conditions that influence the variation are selected for observation.
