The exponential growth in data over the last decade coupled with a drastic drop in cost of storage has enabled organizations to amass a large amount of data. This vast data becomes the new natural resource that these organizations must tap in to innovate and stay ahead of the competition, and they must do so in a secure environment that protects the data throughout its lifecycle and data access in real time at any time. When it comes to security, nothing can rival IBM® Z, the multi-workload transactional platform that powers the core business processes of the majority of the Fortune 500 enterprises with unmatched security, availability, reliability, and scalability. With core transactions and data originating on IBM Z, it simply makes sense for analytics to exist and run on the same platform. For years,

some businesses chose to move their sensitive data off IBM Z to platforms that include data lakes, Hadoop, and warehouses for analytics processing. However, the massive growth of digital data, the punishing cost of security exposures as well as the unprecedented demand for instant actionable intelligence from data in real time have convinced them to rethink that decision and, instead, embrace the strategy of data gravity for analytics. At the core of data gravity is the conviction that analytics must exist and run where the data resides. An IBM client eloquently compares this change in analytics strategy to a shift from "moving the ocean to the boat to moving the boat to the ocean," where the boat is the analytics and the ocean is the data. IBM respects and invests heavily on data gravity because it recognizes the tremendous benefits that data gravity can deliver to you, including reduced cost and minimized security risks. IBM Machine Learning for z/OS® is one of the offerings that decidedly move analytics to Z where your mission-critical data resides. In the inherently secure Z environment, your machine learning scoring services can co-exist with your transactional applications and data, supporting high throughput and minimizing response time while delivering consistent service level agreements (SLAs). This book introduces Machine Learning for z/OS version 1.1.0 and describes its unique value proposition. It provides step-by-step guidance for you to get started with the program, including best practices for capacity planning, installation and configuration, administration and operation. Through a retail example, the book shows how you can use the versatile and intuitive web user interface to quickly train, build, evaluate, and deploy a model. Most importantly, it examines use cases across industries to illustrate how you can easily turn your massive data into valuable insights with Machine Learning for z/OS.

This book presents a collection of state-of-the-art AI approaches to cybersecurity and cyberthreat intelligence, offering strategic defense mechanisms for malware, addressing cybercrime, and assessing vulnerabilities to yield proactive rather than reactive countermeasures. The current variety and scope of cybersecurity threats far exceed the capabilities of even the most skilled security professionals. In addition, analyzing yesterday's security incidents no longer enables experts to predict and prevent tomorrow's attacks, which necessitates approaches that go far beyond identifying known threats. Nevertheless, there are promising avenues: complex behavior matching can isolate threats based on the actions taken, while machine learning can help detect anomalies, prevent malware infections, discover signs of illicit activities, and protect assets from hackers. In turn, knowledge representation enables automated reasoning over network data, helping achieve cybersituational awareness. Bringing together contributions by high-caliber experts, this book suggests new research directions in this critical and rapidly growing field.

The 2009 RSA conference was held in San Francisco, USA, during April 20-24. The conference is devoted to security-related topics and, as part of this, hosts a distinguished track for cryptographic research. Since 2001 the proceedings of this Cryptographers' Track (CT-RSA) have been published in the series Lecture Notes in

Computer Science of Springer. The proceedings of CT-RSA 2009 contain 31 papers selected from 93 submissions, covering a wide variety of cryptographic areas. Each submission was anonymized for the reviewing process and was assigned to at least three of the 25 Program Committee members. Submissions co-authored by committee members were assigned to at least two members. After carefully considering more than 15,000 lines (more than 100,000 words) of reviews and online discussions, the committee selected 31 submissions for acceptance.

The program also included an invited talk by Kenny Paterson

entitled "Cryptography and Secure Channels."

I would like to thank all the authors who submitted papers.

I am also indebted to the Program Committee members and all external reviewers for their voluntary work. The committee's work was tremendously simplified by Shai Halevi's submission software and his support. I would also like to thank the CT-RSA Steering Committee for electing me as Chair, and all the people from the RSA conference team for their support, especially Bree LaBollita.

This two-part commentary argues that Chronicles, placed as it is among the 'historical books' in the traditional Old Testament of

the Christian church, is much misunderstood. Restored to its proper position as the final book in the canon as arranged in the order of the Hebrew Bible, it is rather to be understood as a work of theology essentially directed towards the future. The Chronicler begins his work with the problem facing the whole human race in Adam—the forfeiture of the ideal of perfect oneness with God's purpose. He explores the possibility of the restoration of that ideal through Israel's place at the centre of the world of the nations. This portrayal reaches its climax in an idealized presentation of the reign of Solomon, in which all the rulers of the earth, including most famously the Queen of Sheba, bring their tribute in acknowledgment of Israel's status (Volume 1). As subsequent history only too clearly shows, however, the Chronicler argues (Volume 2), that Israel itself, through unfaithfulness to Torah, has forfeited its right to possession of its land and is cast adrift among these same nations of the world. But the Chronicler's message is one of hope. By a radical transformation of the chronology of Israel's past into theological terms, the generation whom the Chronicler addresses becomes the fiftieth since Adam. It is the generation to whom the jubilee of return to the land through a perfectly enabled obedience to Torah, and thus the restoration of the primal ideal of the human race, is announced.

Getting Started with Kubernetes John Wiley & Sons
Stefan Brands proposes cryptographic building blocks for the design of digital certificates that preserve privacy without sacrificing security. As paper-based communication and transaction mechanisms are replaced by automated ones, traditional forms of security such as photographs and handwritten signatures are becoming outdated. Most security experts believe that digital certificates offer the best technology for safeguarding electronic communications. They are already widely used for authenticating and encrypting email and software, and eventually will be built into any device or piece of software that must be able to communicate securely. There is a serious problem, however, with this unavoidable trend: unless drastic measures are taken, everyone will be forced to communicate via what will be the most pervasive electronic surveillance tool ever built. There will also be abundant opportunity for misuse of digital certificates by hackers, unscrupulous employees, government agencies, financial

institutions, insurance companies, and so on. In this book Stefan Brands proposes cryptographic building blocks for the design of digital certificates that preserve privacy without sacrificing security. Such certificates function in much the same way as cinema tickets or subway tokens: anyone can establish their validity and the data they specify, but no more than that.

Furthermore, different actions by the same person cannot be linked. Certificate holders have control over what information is disclosed, and to whom. Subsets of the proposed cryptographic building blocks can be used in combination, allowing a cookbook approach to the design of public key infrastructures. Potential applications include electronic cash, electronic postage, digital rights management, pseudonyms for online chat rooms, health care information storage, electronic voting, and even electronic gambling.
